EXPLAINER · 4 RULES

How Tetris Works

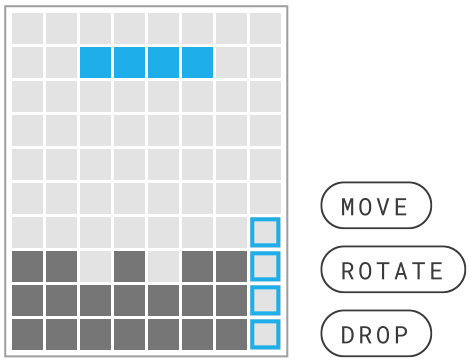

Blocks fall into a well. You steer them so they pack tightly. Complete rows disappear. Keep going as long as you can.

01 A piece falls

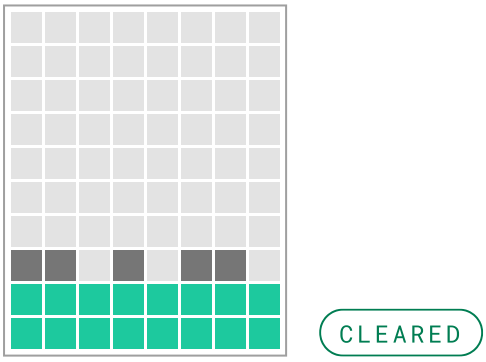

A random shape made of four squares drops from the top, one step at a time.

02 You steer it

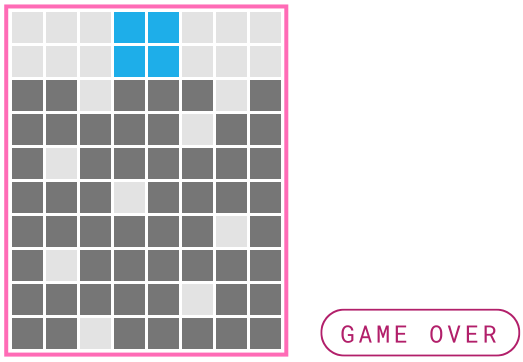

Before it lands, slide it left or right and rotate it to fit the gaps below.

03 Full rows vanish

A row filled edge to edge disappears. Everything above it drops down.

04 Don’t reach the top

If the stack grows so high that a new piece can’t enter, the game is over.

THE SEVEN PIECES

Every piece is built from exactly four squares, which is why the pieces are sometimes called **tetrominoes** (Greek *tetra* = four).
